The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  7846

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ş
                                             The invention relates to a nucleic acid, which comprises a segment of the chemically pretreated DNA of genes associated with DNA transcription from one of 346 sequences, and an oligomer, in particular an oligonucleotide one of 346 sequences, and an oligomer, in particular an oligonucleotide or peptide nucleic acid (PNA)-oligomer that hybridises to or is identical to the chemically pretreated DNA of genes associated with DNA conscription. The set of oligomer probes are useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) in a chemically pretreated genomic DNA. The nucleic acids are useful for diagnosing or treating diseases associated with DNA transcription (particularly with the methylation status), e.g. adenosine deaminase deficiency, viral infection, retroviral infection, Sezary syndrome, tuberculosis, developmental disorders, psoriasis, Reger's syndrome, cubroculosis, developmental disorders, psoriasis, Reger's syndrome, neurological disorders, neurodegenerative disorders, Warardenburg syndrome, Niemann-Pick disease, myelodysplastic syndrome, myocardial confarction, hypertension, anglogenesis, erythropoiesis, congenital heart conscripted genomic DNA molecules of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           06-APR-2000;

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AIDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antiarteriosclerotic; antianaemic; cytostatic; nootropic; neuroprotective; anti-HIV; anticonvulsant; ophthalmological; antirheumatic; antiarthritic; antidiabetic; antipsoriatic; antiinflammatory; cancer; eye disease; arteriosclerosis; ana acute myeloid leukaemia; Alzheimer's disease; AIDS; epilepsy neurofibromatosis; rheumatoid arthritis; psoriasis; bowel di

                                                                                                                                                    Sequences AAS45296-AAS45520 represent chemically pretreated genomic DNA molecules associated with the cell cycle and specific PCR primers of the invention. The sequences are useful for detecting the methylation state of all CpG dinucleotides in a sequence and therefore for analysing associated diseases. By analysing cytosine methylations in the pretreated DNA, genetic and/or epigenetic parameters for the diagnosis and therapy of existing diseases or the predisposition to specific diseases can be ascertained. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The sequences of the invention are useful for the diagnosis and therapy of HIV infection, neurodegenerative disorders, graft-versus-host disease,

The invention relates to a nucleic acid, which comprises a segment of the CC chemically pretreated DNA of genes associated with DNA transcription from CC one of 346 sequences, and an oligomer, in particular an oligonucleotide CC or peptide nucleic acid (PNA)-oligomer that hybridises to or is identical CC transcription. The set of oligomer probes are useful for detecting the CC transcription. The set of oligomer probes are useful for detecting the CC in a chemically pretreated DNA of genes associated with DNA cC diagnosing or treating diseases associated with DNA transcription CC (particularly with the methylation status), e.g. adenosine deaminase CC diagnosing or treating diseases associated with DNA transcription CC (particularly with the methylation status), e.g. adenosine deaminase CC haematological disorders, immunological disorders, yspharome, e.g. achenosine deaminase CC tuberculosis, developmental disorders, psoriasis, Rieger's syndrome, CC syndrome, Nuemann-pick disease, myelodysplastic syndrome, myocardial cc infarction, hypertension, angiogenerative disorders, waardenburg CC syndrome, arthritis, polyglutamine disorders, solid tumours associated genomic DNA molecules of the invention.

CC specification but was obtained in electronic format directly from the CC European Patent Office.

                                                                                                                                                                                                        invention. The sequences are useful for detecting the methylation state of all CpG dinucleotides in a sequence and therefore for analysing associated diseases. By analysing cytosine methylations in the pretreated DNA, genetic and/or epigenetic parameters for the diagnosis and therapy of existing diseases or the predisposition to specific diseases can be ascertained. The parameters may be compared to another set of genetic and/or epigenetic parameters, the differences serving as basis for diagnosis and/or prognosis events which are disadvantageous to patients. The sequences of the invention are useful for the diagnosis and therapy of HIV infection, neurodegenerative disorders, graft-versus-host disease, aging, glomerular disease, Lewy body disease, arthritis,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC The invention relates to a nucleic acid comprising a sequence of 18 CC bases, of a segment of chemically pretreated DNA (CP DNA) e.g. with CC bisulphite, of genes associated with tumour suppression and CC oncogenes having a sequence taken from 536 (actually 533 since CC oncogenes having a sequence taken from 536 (actually 533 since CC complementary to (cs). The nucleic acid may be a CC peptide nucleic acid-oligomer (PNA) of at least 9 nucleotides and may CC form part of a set of probes for detecting the cytosine methylation state and/or single nucleotide polymorphisms and also to be used in an CC array for analysing diseases associated with CpG dinucleotides e.g. CC ascertaining genetic and/or epigenetic parameters for the diagnosis cancers and tumours. The probes can also be used in a method for CC ascertaining genetic and/or epigenetic parameters for the diagnosis CC diseases, by analysing cytosine methylations. The parameters may be CC and/or therapy of existing diseases or the predisposition to specific CC diseases, by analysing cytosine methylations. The parameters may be CC differences serving as basis for diagnosis and/or epigenetic parameters, the CC differences serving as basis for diagnosis and/or prognosis events which CC complementary sequences derived from tumour suppressor genes and CC complementary sequence with even numbered Seq ID numbers are the CC complementary sequence of the corresponding odd numbered sequence (e.g. ID 2 and IDI, ID 536 and ID 535, except for those whose partner sequence CC is missing).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

New nucleic acids or oligomers, useful for diagnosing or treating diseases associated with DNA transcription, e.g. immunological disorders, Werner syndrome, psoriasis, myocardial infarction, solid tumours or cancer

Claim 1; SEQ ID No 100; 32pp; English

CC chemically pretreated DNA of genes associated with DNA transcription from CC one of 346 Sequences, and an oligomer, in particular an oligonucleotide or peptide nucleic acid (PNA)-oligomer that hybridises to or is identical transcription. The set of ollgomer probes are useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) and chemically pretreated genomic DNA. The nucleic acids are useful for detecting the cytosine methylation state and/or single nucleotide polymorphisms (SNPs) and chemically pretreated genomic DNA. The nucleic acids are useful for disposing or treating diseases associated with DNA transcription comparticularly with the methylation status), e.g. ademosine deaminase deficiency, viral infection, retroviral infection, Sezary Syndrome, actuberculosis developmental disorders, psoriasis, Rieger's syndrome, comparative disorders, werner syndrome, comparative disorders, manufaction, hypertension, angiogenerative disorders, Warardenburg comparative, angiogenesis, erythropoitesis, congenital heart correct sequences ABK28127-ABK28472 represent DNA transcription consociated genomic DNA molecules of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a gene (I) derived from Buchnera sp. CC containing the DNA (a) or (b), (a) has a fully defined base pair CC sequence selected from a table of sequences found in the Buchnera sp. CC genomic DNA of ABA92787 given in the specification or is a DNA selected from complementary DNA sequences, and (b) is a DNA which hybridises with the DNA (a) and encodes a protein. Also described are: (1) a recombinant vector (II) containing (I); (2) a transformant (III) containing (II); (3) a genomic DNA of Buchnera sp. containing the sequence given in ABA92788; (4) a plasmid derived from buchnera sp. containing DNA (c) or CC (d), (c) is a DNA containing a fully defined sequence given in ABA92788 and (d) is a plasmid which hybridises with a DNA; and (5) a method for the preparation of a protein in which (III) is cultured and the expression protein of the objective protein is collected from the contained Buchnera sp. denomic DNA sequence represents the specifically claimed Buchnera. The DNA is useful for developing agricultural combinating cockroaches. The present sequence represents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

```
cc signal transduction associated genes. The DNA sequences are chemically condified using a solution of bisulphite, hydrogen sulphite or cdisulphite. Also disclosed are oligonucleotides and/or PNA oligomers compens, and a method for the diagnosis and/or therapy of genetic parameters of genes associated with signal transduction. Cc repigenetic parameters of genes associated with signal transduction. Cc contain DNA, e.g. cell lines, biopsies, blood, sputum, stool, urine, ceyes, intestine, kidney, brain, heart, prostate, lung, breast or liver, cc sequences of the invention are useful for the diagnosis and therapy of sequences of the invention are useful for the diagnosis and therapy of cancer. ABK31159-BBK31545 represent chemically pretreated genomic DNA cc their complementary sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match
